Indian Journal of Public Health Research & Development

EXECUTIVE EDITOR

Vidya Surwade
Associate Professor, Dr Baba Saheb Ambedkar, Medical College & Hospital Rohinee, Delhi

PRINT-ISSN: 0976-0245; ELECTRONIC-ISSN: 0976-5506
FREQUENCY: Quarterly (Four issues per volume)

Indian Journal of Public Health Research & Development is a double-blind peer reviewed international journal. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, and Public Health Laws and covers all medical specialties concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned International Standards Serial Number (ISSN) and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases. The journal is covered by EBSCO (USA), Embase, EMCare & Scopus database. The journal is now part of DST, CSIR, and UGC consortia.

132. A Review on Heterocyclic Compounds in Synthetic, Agricultural and Industrial Applications ............... 717
   K. Srivani, Veerati Radhika, E. Laxminarayana, S. Haripriya

133. An Overview of the Factors Affecting Handovers and Effective Highlights of Handover Techniques for Next Generation Wireless Networks ................................................................. 722
   Pramod Kumar P, CH Sandeep, Naresh Kumar S

134. Definite Aims and Objectives of Teaching English Language ..................................................................... 726
   S. Shailaja, T. Satyanaraya, C. Goverdhan, A. Srinivas

135. Designing a Collaborative Detection System for Detecting the Threats to the Cyber Security in Big Data 730
   Goje Roopa, Dadi Ramesh

136. Identifying the Evolution of Ways towards Thinking about the Students Mathematical Learning Process 734
   R. Archana Reddy, G. Swamy Reddy

137. Impact of English Language Teaching in Technical Education ................................................................. 739
   D. Santhosh, C. Goverdhan, Katyayani Sangam, S. Shailaja, G. Roopa

138. Opportunities for Applying Deep Learning Networks to Tumour Classification ...................................... 742
   Naresh Kumar S, Pramod Kumar P, CH Sandeep, Shwetha S

139. Security Challenges and Issues of the IoT System ..................................................................................... 748
   CH Sandeep, Naresh Kumar S, Pramod Kumar P

140. Relationship between Social Presence and Health Efficacy in VR Health Video ....................................... 754
   Han-Jin Jang, Ghee-Young Noh

141. The Effect of Presence, Physical Environment and Human Service on Revisit Intention in VR Theme Park: Focusing on the Mediated Effect of Delight .................................................................... 761
   Young-Ku Hong, Munseok Cho, Joo-Sang Jeon

142. Psychometric Evaluation of Cost-Reduction Practice .................................................................................. 769
   Miyoung Lee, Mi-Kyoung Lee, Mi Ok Choi, Youngshin Song

143. Periodontal Disease and CRP Relatedness in Korean Adults ................................................................. 775
   Jin-ho Chun, Jung-hwa Lee, Yu-hee Lee

144. Effect of Simulation-based Training for Neonatal Care on Critical Thinking, Critical Judgement, and Problem Solving Ability in Nursing ................................................................. 781
   Hyun A Nam, Ae Young Lee, Miok Kim

145. Moderating Effect of Depression on the Relationship between Subjective Health and Quality of Life in Patients with COPD .................................................................................. 787
   Young-Sook Kwon

146. The Effect of Muscle Activity according to Pelvic Angle in Different Positions: Randomized Crossover Trial .................................................................................................................. 795
   Sang-Pill Park, Hyeon-Ji Son, Dong-Yeop Lee, Ji-Heon Hong, Jae-Ho Yu, Jin-Seop Kim

147. The Changed of Muscle Activation During Different Visual Sign in Bridging Exercise: Randomized Controlled Trial .................................................................................................................. 803
   Young-Hyun Lee, Bo-Eun Lee, Dong-Yeop Lee, Ji-Heon Hong, Jae-Ho Yu, Jin-Seop Kim
148. Comparison of Quadriceps Muscle Activities During Plyometric, Open and Closed Kinetic Chain Exercises .......................................................... 810
   Ji-hyeon Kim(A), Ji-hyeon Kim(B), Ju-yeon Kim, Dong Yeop Lee, Jae Ho Yu, Jin Seop Kim, Ji Heon Hong

149. The Relationship between Social Problem-Solving and Self-Regulation Abilities according to Clinical Practice Experience in Nursing Students .............................................. 817
   Young-Hee Kim, Jung-Hee Jeon

150. A Study of Awareness and Preference for Oral Scanner of Dental Hygiene Students ................. 822
   Yu-Ri Choi, Youn-Soo Shim, Sun-Ok Jang, Su-Young Park

151. A Reinforcement Method of Healthcare Information System ...................................................... 830
   Seong-Hoon Lee, Dong-Woo Lee

152. The Affects of Pulmonary Function after Gym Ball Exercise for Sedentary Behavior Students: Randomized Controlled Trial ......................................................... 837
   Hyuk-Goo Chung, Yong-Soon Kim, Dong-ycop Lee, Ji-Heon Hong, Jae-Ho Yu, Jin-Seop Kim

153. Gene Expression of Pulp Cells from Supernumerary Tooth Through the Passages ......................... 844
   Seungwoo Shin, Jisun Shin, Jongsoo Kim, Younsoo Shim, Soyoung Park, Eunsuk Ahn, Jongbin Kim

154. Keyword Network Analysis for Creativity and Personality of Early Childhood Teachers: Focus on Big Data ........................................................................................................ 850
   Byung-Man Kim, Jeong-Jin Youn, Su-Jeong Jeong, Kang-Hoon Lee

155. The Influence of Social Support on Stress Coping among Nursing Students ..................... 857
   MiJin Kim, Younghee Jeong

156. Antimicrobial Activity of Various Solvent Extracts of Auricularia auricula-judae Against Oral Bacteria 862
   So-Ra Han, Sang-Cheol Yu, Joo-Ho Lee, Sang-Hee Jung, Kun-Ok Lim, Tae-Jin Oh

157. The Effect of Oral Spray Mist Containing Pine Needle Extract in Reducing Halitosis and Compounds Inducing Halitosis .............................................................. 870
   Jung-Eun Park, Jong-Hwa Jang

158. Upper Arm Muscle Activation During Rowing Exercise According to Different Pulling Positions ...... 876
   Da-Hye Gu, Ayano Vargas, So-Yun Jin, Dong Yeop Lee, Jae Ho Yu, Jin Seop Kim, Ji Heon Hong

159. The Effects of Stepping Exercise on Body Composition and Blood Lipids of Female Obese Students 883
   Ki-Yeol Yang, Bum-Il Min, Seong-Gon Kim, Jong-Eon Kim, Hyun-Woo Kim

160. Academic Resilience, Academic Stress, Self-leadership of Korea Nursing Students ................... 889
   Gye-Hyun Jung, Mi-Kyung Kang

161. The Effects of Smartphone Use on the Mechanical Properties of the Upper Trapezius Muscle and Craniocervical Angle ................................................................. 896
   Jong-Hoon Moon, Sung-Jin Heo, Jin-Hwa Jung

162. Proposal for the Improvement of Service Quality of Caregivers ........................................... 903
   Joo-Young Lee, Do-Young Lee

163. The Effects of Team-Based Learning Program on the Self-Directed Learning Capability, Learning Transfer and Learning Satisfaction of Nursing Students ............................ 908
   Joo-Young Lee, Do-Young Lee
164. The Relationship between Oral Health Awareness and Successful Aging in Middle-Aged Women ....... 915
   Eun-Sil Choi, Young-Soo Lee

165. Effects of Muscle Facilitation on Motor Activity and Tactile Perception ........................................... 920
   Sung-Hwa Hong, Yun-Tae Kim, Dong Yeop Lee, Jae Ho Yu, Jin Seop Kim, JiHeon Hong

166. An Empirical Study on the Comprehensive Information System for Reducing Physical Symptoms in
   Colon Cancer Patients ............................................................................................................................. 929
   Seong-Ran Lee

167. A Case Study of Word finding Intervention for the Elderly with Alzheimer’s Dementia at Home ............ 935
   Soo-Jin Kim

168. The Structural Relationships among Professor’s Servant Leadership, Faculty Trust, Learning Flow, and
   Adjustment to College Life ....................................................................................................................... 941
   Boo-Gil Seok, Hyun-Suk Park, Yong-Gun Lee, Hyung-Chul Joo

169. Development of Creativity Program using Disney Animation of Young Children ................................. 946
   Rae-Eun Kim, Sang-Mee Koo

170. Analysis of the Influencing Factors on Life Satisfaction in College Students: A Structural
   Equation Modeling Approach .................................................................................................................... 952
   Jung-Hyun Choi

171. The Structural Relationship between Trust-Forming Factors, Leader Trust, University Trust, University
   Satisfaction, and Maintenance of Relationship in University Physical Education Courses ..................... 958
   Kye-Sok Lee, Seung-Yong Kim

172. Factors Influencing on Dry Eye Symptoms of University Students Using Smartphone ........................ 964
   Jung-hyun Choi, Kyung-sook Kim, Hee-jeong Kim, Se-jin Joo, Hye-gyeong Cha

173. Communication, Emotional Labor and Organizational Commitment among Nurses ....................... 970
    , Sung-Yun Ahn

174. Application of Problem Based Learning (PBL) for Nursing Students’ Practicum in
   Handoff Communication ........................................................................................................................... 977
   Eun-Kyung Lee, Sun Young Park

175. Health Perception and Wellness Behaviors of College Students Participating in Physical Education ..... 982
    Yeong-Gwon Jo, Chun-Ho Yang

176. Factors Affecting the Quality of Life of Male Workers According to the Type of Job ......................... 989
    Myoung-Jin Kwon, Sung-Yun Ahn

177. The Relationship Between Eccentric Strength and Various Dynamic Balance Exercises in
   Male and Female ........................................................................................................................................ 998
   Su-Hyeon Cha, Yong-Min Ji, Dong-Yeop Lee, Ji-Heon Hong, Jin-Seop Kim, Jae-Ho Yu

    Hanyi Lee, Sunyoung Jang

179. A Study on the Subjectivity Study of Single Mothers in Nursing Students : Q-Methodology .......... 1014
    Sunyoung Jang

Fadillah Ismail, Adibah Abdul Kadir, Fazulaini Mohd Yunus, Nur Hayatun Syamila binti Fauzi, Nur Amalina Mohd Rosli

219. Measuring Performance of Islamic Banks Using Maqasid Index ........................................................................ 1256
Siti Aida Sheikh Hussin, Siti Fairuz Kamaruzaman, Zalina Zahid, Siti Shaliza Mohd Khairi

220. Analysis of Critical Success Factors of Startups in Thailand ............................................................................... 1262
Sutthikarn Khong-khai, Hung-Yi Wu

221. Personality as Predictor of Life Satisfaction at Middle-Age Retirement among Army Veterans post-Resettlement Training in Malaysia ................................................................................................................................. 1269
Aminatu Zahriah Mohd Ngamal, Ruslin Amir, Faridah Mydin Kutty, Khairul Anwar Mastor, Raja Rizal Iskandar Raja Hisham, Zaizul Ab Rahman, Harisson Harun

222. The Influence of Electronic Word of Mouth on Theory of Reasoned Action and the Visit Intention to the World Monument Fund Site ................................................................................................................................. 1277
Abdul Hafaz Ngah, Mohd Rahimi Abdul Halim, Norzalita Abd Aziz

223. Using Expectation and Confirmation Theory to Determine Customer Loyalty among Postpaid Users 1283
Syukrina Alini Mat Ali, Wan Jamaliah Wan Jusoh, Abideen Adeyemi Adawale

224. The Role of E-Management in Achieving Sustainable Competitive Advantage: Field Study of Zain Telecom in Iraq ......................................................................................................................................................... 1294
Khaled Abdulah Ibrahim, Shatha Aboud Shaker, Waleed Khalid Abduljabbar

225. Work Family Conflict among Teachers: Evaluating Measurement Model Fit ................................................... 1301
R Zirwatul Aida R Ibrahim, Siti Nazilah Mat Ali, Azlina Abu Bakar, Mazidah Mohd Dagang, Khatijah Omar, Siti Sarawati Johar
226. Organ Donation Intention: The Influence of Attitude, Altruism and Spiritual Belief in Malaysia .......... 1307
   Noor’ain Mohamad Yunus, Dilla Syadia Ab Latiff, Syukrina Alini Mat Ali, Noor Azzah Said, Sri Fatiany Abdul Kader Jailani

227. Measuring the Effectiveness of Hydroponics Technology Knowledge Transfer Program from Universiti Utara Malaysia-Coconut Island Resources on Rural Community: A Case Study in Jitra, Kedah .......... 1315
   Shri-Dewi Applanaidu, Roslina Kamaruddin, Rozana Samah

   Badariah Haji Din, Muzafar Shah Habibullah, A. H. Baharom

229. Identifying Critical Crime Contribute Factors towards Improving University Facilities ..................... 1337
   NurFaiza Hussin, Radzi Ismail, Mohd Nizam Mohd Yusof, Salman Riazi Mehdi Riazi

230. Items’ Validity and Reliability Using Rasch Measurement Model for Factors that Influence Clothing Disposal Behaviour ..................................................................................................................... 1344
   Arasinah Kamis, Farah Najwa Ahmad Puad, Suriani Mohamed, Ridzwan Che’ Rus, Baity Bujeng, Rodia Syamwil, Emy Budiastuti

231. Reflection on Teaching ‘Statistics in Education’ for Postgraduates Students ......................................... 1354
   Arsaythamby Veloo, Hariharan N Krishnasamy, Razlan Md. Ali

232. Scientific Imperatives in Entailing the Legitimacy for Harm Reduction Approach to Drug Use:
   Reduction of HIV Incidence .................................................................................................................. 1363
   Yusramizza Md Isa Yusuff, Mazita Mohamed

233. Linking Transformational Leadership to Firm Innovativeness .............................................................. 1370
   Donny Abdul Latief Poespowidjojo, Azahari Ramli, Ahmed Mohammed Kamaruddeen, Muhammad Shukri Bakar, Khairunnisah Ahmad Shakir

   M. G. Hassan, M. D. Akanmu, A. Y. Bahauadin

235. Livelihood Assets and Food Security Achievement : An Empirical Study of the Coastal Fishermen in Northern Peninsular Malaysia ................................................................................................. 1383
   Ahmad Zubir Ibrahim, Kalthum Hassan, Roslina Kamaruddin, Abdul Rahim Anuar

236. A Preliminary Insight into the Nature of Street-Level Bureaucracy amongst Front-Line Workers of the Malaysian Social Welfare Department ........................................................................................................ 1391
   Ahmad Shukri Abdul Hamid, Noor Azizah Ahmad, Norruzeyati Che Mohd. Nasir

237. Correctional Rehabilitation of Inmates: A Solution to Reduce Recidivism in Oke Kura Prison
   Kwara State, Nigeria .......................................................................................................................... 1397
   Jamaludin Mustaffa, Kehinde Adekunle Aliyu

238. Towards Formulating a Specific Legislation on the Law of Presumption of Death in Malaysia .......... 1404
   Nor Azlina Mohd Noor, Ahmad Shamsul Abd Aziz, Akmal Hidayah Halim

239. The Restricted Autonomy of Will: The Disregarded Values in Shariah Based Contract ....................... 1410
   Hakimah Yaacob, Selamah Maamor

240. The Homeless Life: A Profile Study in Penang ....................................................................................... 1417
   Md Zawawi Abu Bakar, Rajwani Md Zain, Azlizamani Zubir Salim
241. The Matrimonial Property: Causes of Claim and Distribution Rate in the Alor Setar Syariah High Court ..... 1423
   Mohd Akram Bin Dato’ Dahaman Dahlan, Khairani BtNawawi

242. The Green and Sustainable Care Facilities of Elderly Care Home: An Exploratory study of
   Rumah Seri Kenangan Cheras, Selangor ................................................................. 1430
   Hasif Rafidee Hasbollah, Mohd. NazaruddinYusoff, Mohd Nasrun Mohd Nawi

243. Travel Motivation of Malaysian University Students ................................................. 1440
   Ahmad Edwin Mohamed, Kalsom Kayat

244. Development of Malaysian Women Fertility Index .................................................... 1448
   Shamshuritawati Sharif, Wan AznieFatihah, Adzmel Mahmud

245. Role of Brand Love and Brand Commitment in Establishing Word of Mouth Communication ........ 1454
   Sri Murni Setyawati, Donny Abdul Latief Poespowidjojon, Kristina Anindita Hayuningtias

246. Screening of Escherichia Coli O157:H7 Contamination and Nitrate Content on Butterhead Lettuce from
   Market Outlets ........................................................................................................... 1460
   Siti Fairuz Yusoff\textsuperscript{1}, Mahmud Tengku Muda Mohamed, Farah Farhanah Haron

247. Effect of ESSZONE Establishment on Maritime Security and Economic Activity: A Case Study of
   Tawau District ............................................................................................................. 1467
   Abdul Rahim Anuar, RusdiOmar, Laila Suriya Ahmad Apandi, Dewi Natasha Rasid

248. Sustainable Property Development: A Challenge ...................................................... 1476
   Mohd Nazaruddin Yusoff, Hooman Abadi, Azlizan Talib, Mohd Nasrun Mohd Nawi, Nurul Azita Salleh,
   Md Azree Othuman Mydin

249. Effective Leadership as the Mediator between Emotional Quotient and Teachers’ Work Performance:
   A Study in National Secondary School in Northern States of Peninsular Malaysia .................. 1483
   Azizi Abu Bakar, Siti Nur Zahirah Omar

250. Developing a Telehealth Readiness Assessment Framework and Tool for Least Developed Countries:
   A case of Yemen .......................................................................................................... 1489
   Abdulrahman A Al-Fadhli, Marini Othman, Hussein M Abu Al-Rejal, Bassam A Al-Jamrh

251. Does Rural People Socially Mobile? Evidence from Northern Region of Malaysia .................. 1499
   Zalina Zainal, Mukaramah-Harun, Siti Hadijah Che Mat

252. The Preceding Role of Social: Innovation, Knowledge, Capital and Entrepreneurship as Mediating
   Effects in Building Malaysian SME Business Performance ........................................ 1509
   Jamal Mohammed Esmail Alekam, Shahrina Othman, Mohd Rizam Md Ladin, Ahmad Said Alshuaibi

253. Examining Level of Spirituality among Malaysian Youth ............................................. 1515
   Nik Safiah Nik Abdullah, Abdullah Abd Ghani, Selamah Maamor, Norazlina Abd Wahab, Mohd Shahril
   Ahmad Razimi, Ahmad Bashir Aziz, Nor Hanim Elias

254. Enhancing Construction Health and Safety through the Practices of Reuse and Recycle in
   Waste Management among Malaysian Contractors .................................................... 1521
   Mohd Nasrun Mohd Nawi, Najuwa Mohd Nasir, Rahimi Abidin, Nurul Azita Salleh, Aizul Nahar Harun,
   Wan Nadzri Osman, Md Fauzi Ahmad

255. Readiness for Shared Services in Higher Learning Institution: A Pilot Study ....................... 1527
   Juraifa Jais, Prashalini Naidu, Nor Hazlin Nor Ashidin, MaslindaMd Yusof

Survival Analysis of Chronic Kidney Disease Patients using Stratified Cox Regression in Arifin Achmad Hospital, Pekanbaru, Riau

Muhammad Muhajir¹, Cynthia Hazirah Imanina¹
¹Department of Statistics, Faculty of Mathematics and Science Islamic University of Indonesia, Yogyakarta, Indonesia

ABSTRACT

Chronic Kidney Disease (CKD) is a clinical condition characterized by decreased kidney function requiring renal replacement therapy were fixed, in the form of dialysis. The mortality rate caused by CKD increases significantly each year and needs to be reduced. The purpose of this study to determine the factors that affect patients from CKD in hospitals Arifin Achmad, Pekanbaru, Riau in 2015-2017. The sample of this study amounted to 230 samples. One of the tools to analyze the longer survival of patients with CKD is cox proportional hazards regression. In the long survival data of patients with CKD there is a possibility of ties, so there is one method in determining the partial likelihood estimation parameters, that is exact.

Based on the analysis results obtained the factors that most influence with the best parameter estimation is the exact approach are diastolic blood pressure, respiratory rate, urea levels, and action. There is a variable that does not meet the proportional hazard assumption, is the action variable. One way to overcome this by using Cox Stratified Regression Without Interaction and Cox Stratified Regression with Interaction. Based on the results of the analysis that meets the proportional hazard assumption is the method of Cox Stratified Regression Without Interaction and obtained the factors that affect the length of survival of CKD patients are age, diastolic blood pressure, respiratory rate, and urea levels. Interpretation of equation model of Cox Stratified Regression Without Interaction obtained result of increase of age patient have chance to die bigger of 1.0208 times, increase of diastolic blood pressure patient has chance to die smaller equal to 1.0571 times, increase of respiration rate patient have chance to die bigger equal to 1.0677 times, and increase of ureum level patient have chance to die bigger of 1.0073 times.

Keywords: CKD, Cox Proportional Hazard, Stratified Cox

INTRODUCTION

Chronic kidney disease (CKD) is a condition in which the kidneys are damaged or cannot filter blood as well as healthy kidneys¹. CKD is a global public health problem with increased prevalence and incidence of CKD, poor prognosis and high costs. The prevalence of CKD increases with the increasing number of elderly population and the incidence of diabetes mellitus and hypertension. About 1 in 10 global populations experience CKD at a particular stage. The result of systematic review and metaanalysis conducted by Hill et al, 2016, get the global prevalence of CKD of 13.4%. According to the 2010 Global Burden of Disease results, CKD was the 27th leading cause of death in the world in 1990 and increased to 18th in 2010. In Indonesia in 2013, 499,800 Indonesians suffered CKD. While in Indonesia, the treatment of kidney disease is the second largest funding ranking of BPJS health after heart disease². Based on the Basic Health Research data of 2013, the prevalence of CKD in Riau Province is 0.1% of the population of patients with kidney disease in Indonesia, including patients undergoing treatment, renal replacement therapy, peritoneal dialysis, and hemodialysis by 2013³.

Arifin Achmad Hospital is one of the government-owned hospitals in the city of Pekanbaru, Riau. This hospital is used as a referral hospital from government hospitals and puskesmas in Riau Province. In addition the hospital also has hemodialysis service and installation of CAPD (Continuous Ambulatory Peritoneal Dyalisis) for patients with CKD. CKD itself is a disease classified in the list of 10 major outpatient diseases. CKD lies in the
9th sequence after medical observation and evaluation for alleged illness and condition, gastric function disturbance, lower back pain, impact teeth, follow-up examination after fracture treatment, primary essential hypertension, insulin dependent militant militus, and other ear disorders outside.

Departing from the background of the above phenomenon, then selected life test analysis method as a method of analysis to solve the problem. Life test analysis is an analysis of the individuals of one population by focusing on the length of time the individual performs its function well until the individual’s healing or death. Live test data usually will follow a certain distribution pattern. Therefore, in this study will be compared some results of life test analysis using Cox regression method.

In addition to looking for factors that influence and the best model of CKD data in RSUD Arifin Achmad Pekanbaru, Riau, there is one assumption that must be met in cox regression method that is proportional hazard assumption. This assumption is useful for examining the independent variables in the model meeting the proportional hazard assumptions or not. If the assumption is fulfilled then the model can be directly interpreted, whereas if the assumption is not met can be done two ways. First issue an independent variable that does not meet the proportional hazard assumption with the Cox Stratified Regression method. Independent variables that previously met proportional hazard assumptions remain included in the model, but not strata in those variables.

METHODOLOGY

The data used in this study is secondary data in the form of medical record data of CKD patients in 2015-2017 at Arifin Achmad Hospital, Pekanbaru, Riau. In this study, the target population was taken namely patients affected by chronic kidney disease from 2015-2017 which amounted to 454 patients. As well as the sample that the authors use in this study as many as 230 patients. The research variables used were survival variable as dependent variable, while the independent variables used were gender variables (X1), age (X2), disease history (X3), systolic blood pressure (X4), diastolic blood pressure (X5), respiratory rate (X6), pain (X7), pain scale (X8), diabetes mellitus (X9), urea (X10), creatine (X11), action (X12), dan therapy (X13). The research method used as follows:

a. Cox Proportional Hazard Regression with Paramal Likelihood Parameter Estimation Approach
Cox regression is generally more commonly used in the health field, but the growing time of Cox regression can be applied to other fields. In general, the Cox Proportional Hazard equation can be written as follows:

\[ h(t, X) = h_0(t) \exp(\beta_1X_1 + \beta_2X_2 + \ldots + \beta_pX_p) \]

The method with partial likelihood exact approach is an alternative method of case incident. However, this method has a very intensive computational level but is capable of generating estimated parameters that have a bias close to 0 even if the data of joint events or ties are of a very large size. In general, the partial likelihood exact approach has the following form of equation:

\[ L(\beta_{\text{Exact}}) = \prod_{i=1}^{n} \frac{\exp(c_iS_i)}{\sum_{k=0}^{\infty} \exp(c_kX_i)} \]

b. Testing Parameters: In regression cox proportional hazard required testing the significance of parameters in order to know whether the independent variable significantly affect the cox equation formed. Testing of significance is done by simultaneous test (overall), partial test, and proportional hazard assumption test.

1. Overall Test
Hypothesis : \( H_0 : \beta_i = 0 \)
\( H_1 : \) At least there is one \( \beta_i \neq 0 \) where \( i = 1, 2, \ldots, p \)
Level of Significance: \( \alpha = 5\% = 0.05 \)
Statistic Test: \( G = -2[\ln L_R - \ln L] \) ...(3)
Area of Critism: \( H_0 \) is rejected if \( p\text{-value} \leq \alpha \) or \( G \geq \chi^2_{\alpha, ab/p} \)

2. Partial Test
Hypothesis: \( H_0 : \beta_i = 0 \)
\( H_1 : \beta_i \neq 0 \) where \( i = 1, 2, \ldots, p \)
Level of Significance: \( \alpha = 5\% = 0.05 \)
Statistic Test: \( Z = \frac{\hat{\beta}_i}{SE(\hat{\beta}_i)} \) ...(4)
Area of Critism: \( H_0 \) is rejected \( p\text{-value} \leq \alpha \) or \( |Z| \geq Z_{\alpha/2} \)
3. Proportional Hazard Assumptions Test

Hypothesis: $H_0 : \rho = 0$ (Proportional hazard assumptions are met)

$H_1 : \rho \neq 0$ (Proportional hazard assumptions are not met)

Level of Significance: $\alpha = 50\% = 0.05$

Statistic Test: $p$-value \(\ldots(5)\)

Area of Critism: $H_0$ is rejected $p$-value $\leq \alpha$

c. Selection of the Best Model: AIC method is a method that can be used to select the best regression model invented by Akaike and Schwarz\(^7\). How to select several models to choose the best model is based on AIC with the following formula:\(^+\):

$$AIC = 2 \ln \hat{L} + 2k$$

d. Cox Stratified Regression: Cox Stratified Regression is one of the methods used to overcome independent variables that have non proportional hazard assumptions. Cox Stratified model is a modification of the Cox Proportional Hazard model in which the Cox Stratified model divides the hazard function into the strata or stages of the covariate. The covariates divided into these strata are covariates that do not meet the proportional hazard assumptions\(^5\).

Cox Stratified model without interaction is as follows:

$$h_g(t, X) = h_{0g}(t)\exp(\beta_1X_1 + \beta_2X_2 + \ldots + \beta_pX_p) \ldots(7)$$

The Stratified Cox model with interaction is as follows:

$$h_g(t, X) = h_{0g}(t)\exp(\beta_1X_1 + \beta_2X_2 + \ldots + \beta_pX_p) \ldots(8)$$

RESULTS

There are three forms of probability distribution of survival, namely parametric survival function, non-parametric survival function, and semi-parametric survival function. In this parametric survival function there are three methods, namely Regression with Exponential Distribution, Weibull, and Log-Logistics. While in this semi-parametric survival function there is one method, namely Cox Regression. In this study, the data obtained will be comparative analysis using regression method with parametric and semi parametric survival function. Based on calculations using software R, then obtained comparison of analysis using regression method of survival function with the best parameter estimation as follows:

<table>
<thead>
<tr>
<th>Regression Models</th>
<th>AIC Values</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Cox with Exact Partial Likelihood Approach Method</td>
<td>321.0316</td>
</tr>
</tbody>
</table>

Based on Table 1, it’s to obtain the best model by looking at the smallest AIC value as a relative measure of the fit goodness of the statistical model. The smallest AIC value is in Cox Regression model with Exact Parameter Estimation. Furthermore, because the value of AIC for regression analysis with parametric survival function and cox regression with Breslow and Efron Partial Likelihood parameter estimation still big enough, then the next step the authors do regression analysis using cox regression method with estimated parameters of Exact Partial Likelihood.

Cox Regression with Exact Partial Likelihood Approach Method: The parameter estimation using the exact partial likelihood approach method is the same parameter estimation method as the approach of the efron parameter used to overcome the common occurrence in small and large size. However, the approach method of the exact parameter is capable of producing better estimation value. It’s caused by the resulting error is close to zero compared to other parameter estimation approach methods. The calculation result of cox regression parameter with approach of partial likelihood approach is obtained by the model determined by using backward elimination method. Backward elimination method is a way to get the best model by issuing one by one the largest $p$-value first. Based on calculations using software R, then obtained the best parameter estimation as follows:
Table 2: Best Parameter Estimation Results Using Cox Regression with Exact Partial Likelihood Approach

<table>
<thead>
<tr>
<th>Variables</th>
<th>Coefficients</th>
<th>p-value</th>
<th>p-value</th>
<th>Decisions</th>
</tr>
</thead>
<tbody>
<tr>
<td>$X_2$</td>
<td>0.0245</td>
<td>0.0290</td>
<td>&lt; 0.05</td>
<td>Reject $H_0$</td>
</tr>
<tr>
<td>$X_5$</td>
<td>-0.0592</td>
<td>3.01 x 10^-8</td>
<td>&lt; 0.05</td>
<td>Reject $H_0$</td>
</tr>
<tr>
<td>$X_6$</td>
<td>0.0679</td>

</tr>
<tr>
<td>$X_{12}$ (Drug Administration, Blood Transfusion and Surgery)</td>
<td>-1.9646</td>
<td>0.0002</td>
<td>&lt; 0.05</td>
<td>Reject $H_0$</td>
</tr>
</tbody>
</table>

Based on Table 2 it can be seen that the p-value of all variables is less than 0.05, so $H_0$ rejected. This is because the p-value < level significance. It can be concluded that the cox regression model with parameter estimation using the exact partial likelihood approach is feasible to use. The model formed is as follows:

$$h(t, X) = h_0(t) \exp(0.0245X_2 - 0.0592X_5 + 0.067X_6 + 0.0081X_{10} - 1.6761X_{12} \text{ (Drug administration and blood transfusion)}) - 1.9646X_{12} \text{ (Drug administration, Blood transfusion and Surgery)}$$

The next step to find out whether a best equation using cox regression method with exact partial likelihood approach has independent variable which influence significantly to dependent variable, hence need to do testing which include test of overalls, partial test, and proportional hazard assumption test. Based on the results of the analysis of the overall test on the cox regression with exact partial likelihood approach can be concluded with the significance level of 0.05 $H_0$ rejected, because the p-value < significance level, ie 0 < 0.05, causing one of the parameters contained in regression $\beta_i$ has a value not equal to 0. Therefore it is necessary to do a partial test to examine one by one regression coefficient $\beta_i$.

Based on the partial test results obtained results that the six variables in Table 1 are analyzed significantly to the model. This is because the p-value < level of significance, thus causing the six variables affect the long survival of CKD patients. Further testing of proportional hazard assumptions by using the Schoenfeld Residual correlation value. Schoenfeld’s residual value is one of the statistical tests used in this method. Based on calculations using software R, then Schoenfeld residual value obtained as follows:

Table 3: Schoenfeld Residual Correlation Value

It can be seen in Table 3 that not all variables have p-value more than 0.05. Based on the result of assumption test proportional hazard can be concluded with significance level 0.05 $H_0$ failed to be rejected for variable $X_5$, $X_6$, $X_{10}$, because the p-value > level of significance. Then it can be concluded that there is data that supports the value of $H_0$, so that the four independent variables meet the proportional hazard assumption. While the significance level of 0.05 $H_0$ is rejected for $X_{12}$ variables with the category of Drug Administration and Blood Transfusion and Drug Administration, Blood Transfusion and Surgery category, because the p-value < level of significance. Then it can be concluded that there is data that supports the value of $H_1$, thus causing the two independent variables do not meet the proportional hazard assumption. The next step to overcome these problems, the authors tries to issue a variable that does not meet the proportional hazard assumptions and use Cox Stratified Regression.
Cox Regression with Exact Partial Likelihood Estimation Approach Without Action Variable in Overcoming Non Proportional Hazard Assumptions:
One of the easiest ways to overcome the non proportional hazard assumption is by removing the independent variable from within the model. In this research, the authors use exact partial likelihood parameter approach. The calculation result of cox regression parameter with exact partial likelihood approach without action variable in overcoming non proportional hazard assumption using software R as below:

Table 4: Best Parameter Estimation Results Using Cox Regression with Exact Partial Likelihood Approach Without Action Variable in Overcoming Non Proportional Assumptions Hazard

<td>$1.02 \times 10^{-6}$</td>
<td>&lt;</td>
</tr>
</tbody>
</table>

Based on Table 4 it can be seen that the p-value of all variables is less than 0.05, so $H_0$ is rejected. It because the p-value < level of significance. It can be concluded that the cox regression model with parameter estimation using the exact partial likelihood approach without the action variable is feasible to use. The model formed is as follows:

$$h(t, X) = h_0(t) \exp (0.0316 X_2 - 0.0532 X_5 + 0.0612 X_6 + 0.0076 X_{10})$$

The next step is to find out whether a best equation using cox regression method with exact partial likelihood approach without action variable has independent variable which have significant effect to dependent variable, it is necessary to test which include test of overalls, partial test, and proportional hazard assumption test. Based on the result of the analysis of the overall test on the cox regression with exact partial likelihood approach without the action variable can be concluded with the significance level of 0.05, $H_0$ rejected, because the p-value < significance level, ie $4.846 \times 10^{-13} < 0.05$, which causes one of the parameters contained in the regression $\beta_i$ has a value not equal to 0. Therefore it is necessary to do a partial test to examine one by one regression coefficient $\beta_i$.

Based on the partial test results obtained the result that the four variables in Table 4 were analyzed significantly to the model. This is because the value of p-value < level of significance, thus causing the four variables affect the long survival of CKD patients. Further testing of proportional hazard assumptions by using the Schoenfeld Residual correlation value. Based on calculations using software R, then Schoenfeld residual value obtained as follows:

Table 5: Schoenfeld Residual Correlation Value

<table>
<thead>
<tr>

</tr>
<tr>
<td>$X_{10}$</td>
<td>$-0.0618$</td>
<td>0.605</td>
<td>&gt;</td>
</tr>
</tbody>
</table>

It can be seen in Table 5 that all variables have p-value values greater than 0.05. Based on the result of testing proportional hazard assumption can be concluded with significance level 0.05 $H_0$ failed to be rejected for all variable, because the p-value > level of significance. So it can be concluded that there is data that supports the value of $H_0$, so that the four independent variables meet the proportional hazard assumption. The next step test is to find out another way against the variable that does not meet the proportional hazard assumption, namely using Cox Stratified Regression.

Cox Stratified Regression in Overcoming Non-Proportional Hazard Assumptions: Cox stratified regression is one way to overcome independent variables that do not meet proportional hazard assumptions. Cox Stratified Regression is a modification of the Cox
Regression model by strata on independent variables that do not meet the proportional hazard assumptions. Independent variables that previously met proportional hazard assumptions remain included in the model, but not strata in those variables.

Cox Stratified Regression without Interaction: Regression method Cox stratified without interaction is a method to overcome the assumption of non-proportional hazard that produces the model with the same parameters assumption. Based on calculations using software R, then obtained parameter estimation as follows:

Table 6: Parameter Estimation Results Using Cox Stratified Regression Without Interaction

<table>
<thead>
<tr>
<th>Variables</th>
<th>Coefficients</th>
<th>p-value</th>
<th>Decisions</th>
</tr>
</thead>
<tbody>
<tr>
<td>X₂</td>
<td>0.0206</td>
<td>0.059</td>

<td>&lt;</td>
</tr>
<tr>
<td>X₆</td>
<td>0.0655</td>
<td>5.84×10⁻⁵</td>
<td>&lt;</td>
</tr>
<tr>
<td>X₁₀</td>
<td>0.0073</td>
<td>2.90×10⁻⁶</td>
<td>&lt;</td>
</tr>
</tbody>
</table>

Based on Table 6 it can be seen that not all variables have p-value less than 0.05. However, this does not have a significant effect due to stratified Cox regression without this interaction only to overcome the problem of unfulfilled proportional hazard assumptions. Then the parameter estimation in Table 6 obtained the model formed is as follows:

\[ h(t, X) = h_0(t)\exp(0.0206 X₂ - 0.0555 X₅ + 0.0655 X₆ + 0.0073 X₁₀) \]

The next step to find out whether a best equation using stratified Cox regression method without interaction has independent variables that significantly affect the dependent variable, it is necessary to test that includes the test of overalls, partial test, and proportional hazard assumptions test. Based on the result of partial test, it is found that not all variables in Table 6 are analyzed significantly to the model. This is because there are only three variables, namely X₅, X₆, and X₁₀ which have the p-value < level of significance, thus causing the three variables affect the long life of CKD patients. While one of variable, that is X₂ has the p-value > level of significance, so cause variable X₂ does not have an effect on long life of CKD patient. However, the variable X₂ remains incorporated into the model, due to stratified Cox regression without this interaction only to overcome the problem of unfulfilled proportional hazard assumptions. Further testing of proportional hazard assumptions by using the Schoenfeld Residual correlation value. Based on calculations using software R, then Schoenfeld residual value obtained as follows:

Table 7: Schoenfeld Residual Correlation Value

<table>
<thead>
<tr>
<th>Variables</th>
<th>Correlation</th>

<td>0.405</td>
<td>&gt;</td>
</tr>
<tr>
<td>X₆</td>
<td>0.0425</td>
<td>0.808</td>
<td>&gt;</td>
</tr>
<tr>
<td>X₁₀</td>
<td>-0.0480</td>
<td>0.731</td>
<td>&gt;</td>
</tr>
</tbody>
</table>

It can be seen in Table 7 that all variables have p-value values greater than 0.5. Based on the result of testing proportional hazard assumption can be concluded with significance level failed to be rejected for all variable, because the p-value > level of significance. So it can be concluded that there is data that supports the value of, so that the four independent variables meet the proportional hazard assumption.

Cox Stratified Regression with Interaction: Cox stratified regression method with interaction is a method to overcome non-proportional hazard assumption which produce model with different parameter assumption for each strata. Based on calculations using software R, then obtained parameter estimation as below:
Table 8: Parameter Estimation Results Using Cox Stratified Regression with Interaction

<td>-0.0036</td>
<td>0.3060</td>
<td>&gt;</td>
</tr>
<tr>
<td>X10 × X12 (Drug Administration, Blood Transfusion and Surgery)</td>
<td>0.0170</td>
<td>0.2212</td>
<td>&gt;</td>
</tr>
</tbody>
</table>

Based on Table 8 it can be seen that not all variables have the p-value less than 0.05. This does not, however, have a significant effect due to stratified cox regression with this interaction only to overcome the problem of unfulfilled proportional hazard assumptions. Then the parameter estimation in Table 8 obtained model which formed is as follows:

\[ h_g (t, X) = h_{0g}(t) \exp\{0.0239 X_2 - 0.0570 X_5 + 0.0914 X_6 + 0.0089 X_{10} - 0.0193 (X_2 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) + 0.2028 (X_2 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) + 0.0058 (X_5 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) - 0.0548 (X_5 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) - 0.0641 (X_6 \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) + 0.4112 (X_6 \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)}) - 0.0036 (X_{10} \times X_{12} \text{ (Drug Administration and Blood Transfusion)}) + 0.0170 (X_{10} \times X_{12} \text{ (Drug Administration, Blood Transfusion and Surgery)})\} \]

The next step is to find out whether a best equation using cox stratified regression method with interaction has independent variable that significantly influence dependent variable, it is necessary to do testing which include test of overalls, partial test, and proportional hazard assumption test. Based on the results of the overall test analysis on stratified cox regression with interaction can be concluded with a significance level of 0.05 H_0 rejected, because the p-value < significance level, ie \(1.225 \times 10^{-10} < 0.05\), which causes one of the parameters contained in the regression \(\beta\) has a value not equal to 0. Therefore it is necessary to do a partial test to examine one by one regression coefficient \(\beta_i\).

Based on the partial test results obtained the results that not all variables in Table 8 analyzed significant to the model. This is because there are only three variables, namely X_5, X_6, and X_{10} which have the p-value < level of significance, thus causing the three variables to affect the long life of CKD patients. While the rest have the p-value > level of significance, thus causing these variables do not affect the long survival of CKD patients. However, the non-influencing variables are still incorporated into the model, due to stratified cox regression with this interaction only to overcome the problem of non-fulfillment of proportional hazard assumptions. Further testing of proportional hazard assumptions by using the Schoenfeld Residual correlation value. Based on calculations using software R, then Schoenfeld residual value obtained as follows:
Table 9: Schoenfeld Residual Correlation Value

<table>
<thead>
<tr>

<tr>
<td>X10 × X12 (Drug Administration, Blood Transfusion and Surgery)</td>
<td>0.1103</td>
<td>0.607</td>
<td>Failed to Reject H₀</td>
</tr>
</tbody>
</table>

It can be seen in Table 9 that all variables have p-value values greater than 0.05. Based on the result of testing proportional hazard assumption can be concluded with significance level 0.05 H₀ failed to be rejected for all variable, because the p-value > level of significance. So it can be concluded that there is data that supports the value of H₀, so that the four independent variables meet the proportional hazard assumption.

**Selection and Interpretation of the Best Cox Regression Model:** To get the best model can be done comparison of AIC value of each regression model that formed. The AIC value is a relative measure of the fit goodness of the statistical model. Based on calculations using software R, then obtained comparison of analysis using cox regression method as follows:

Table 10: Selection of the Best Model of Cox Regression with AIC Value Comparison

<td>( h_g(t, X) = h_{0g}(t) \exp\left(0.0239 X_2 - 0.0570 X_5 + 0.0914 X_6 + 0.0089 X_{10} - 0.0193 (X_2 \times X_{12} (\text{Drug Administration and Blood Transfusion})) + 0.2028 (X_5 \times X_{12} (\text{Drug Administration,Blood Transfusion and Surgery})) + 0.0058 (X_6 \times X_{12} (\text{Drug Administration and Blood Transfusion})) -0.0548 (X_5 \times X_{12} (\text{Drug Administration,Blood Transfusion and Surgery})) -0.0641 (X_6 \times X_{12} (\text{Drug Administration and Blood Transfusion})) + 0.4112 (X_6 \times X_{12} (\text{Drug Administration,Blood Transfusion and Surgery})) -0.0036 (X_{10} \times X_{12} (\text{Drug Administration and Blood Transfusion})) + 0.0170 (X_{10} \times X_{12} (\text{Drug Administration,Blood Transfusion and Surgery}))\right) )</td>
<td></td>
</tr>
</tbody>
</table>
Based on Table 10 to get the best model by looking at the smallest AIC value, that is equal to on Cox Stratified Without Interaction Regression model. The best model that is formed is as follows:

<table>
<thead>
<tr>
<th>Variables</th>
<th>Coefficients</th>
<th>Exp (Coefficients)</th>
</tr>
</thead>
<tbody>
<tr>
<td>$X_2$</td>
<td>0.0206</td>
<td>1.0208</td>
</tr>
<tr>
<td>$X_5$</td>
<td>-0.0555</td>
<td>0.9460</td>
</tr>
<tr>
<td>$X_6$</td>
<td>0.0655</td>
<td>1.0677</td>
</tr>
<tr>
<td>$X_{10}$</td>
<td>0.0073</td>
<td>1.0073</td>
</tr>
</tbody>
</table>

$h_g(t, X) = h_{0g}(t) \exp (0.0206 \times X_2 - 0.0555 \times X_5 + 0.0655 \times X_6 + 0.0073 \times X_{10})$

The above model can be interpreted as follows:

1. At Variable Age has a positive influence. The value of this variable hazard ratio states that with every age, the patient has a greater chance of dying by $1.0208$ times.

2. In Diastolic Blood Pressure Variables have a negative effect. The hazard ratio value of this variable states that every increase in diastolic blood pressure, then the patient has a smaller chance of dying by $0.9460$ times.

3. In the respiratory rate variable has a positive effect. The value of this variable hazard ratio states that each increase in the respiratory rate, then the patient has a greater chance of dying by $1.0677$ times.

4. In the Urea Content Variables have a positive effect. The value of the hazard ratio of this variable states that every increase in urea level, then the patient has a greater chance of dying by $1.0073$ times.

**CONCLUSIONS**

The best regression model equation is Cox Stratified Regression without Interaction formed is as follows:

$h_g(t, X) = h_{0g}(t) \exp (0.0206 \times X_2 - 0.0555 \times X_5 + 0.0655 \times X_6 + 0.0073 \times X_{10})$

Based on the above equation, the factors that influence the duration of survival of patients with chronic kidney disease are age, diastolic blood pressure, respiratory rate, and urea level. Interpretation of the above model equation is obtained as the result of increasing the age of the patient has a chance to die larger by $1.0208$ times, the increase in diastolic blood pressure of the patient has a chance to die smaller by $0.9460$ times, increased respiration rate of patients have a greater chance to die by $1.0677$ times, and increased urea levels of patients have a greater chance of dying by $1.0073$ times.
